## ACKNOWLEDGMENTS

The writer wishes to express his appreciation to Dr. J. B. Kelley, who has served in the role of major professor and general advisor. He wishes also to express his thanks to the members of his committee, Dr. Sam Adams, Dr. Ralph Schmidt, Dr. Robert Von Brock, Dr. Thomas Landry, and Dr. Edwin Davis; to Northeast Louisiana State College, especially to Dr. George T. Walker and Dean James Nicholson for making the I.B.M. facilities available; to Dean Fred Vogel for making the necessary records available; and to Dr. Lavelle Haynes for I.B.M. work. The job could not have been finished without the encouragement and help of his wife, Mrs. Juanita Cardozier Kilpatrick.

## ABSTRACT

This study dealt with the ability of the entrance tests at Northeast Louisiana State College to predict academic achievement for the freshman and sophomore years of undergraduate work.

Two groups of students were studied. The first group was composed of 434 freshmen students and a second group of 648 freshmen students who entered Northeast Louisiana State College in the Fall semester of 1960 and 1962 and who remained in college long enough to receive one or more grades in the areas of English, mathematics, science, or social studies. The raw scores on the School and College Ability Tests in the verbal areas, quantitative areas, and combined or total verbal and quantitative areas were correlated with the actual grade point averages of each student in the two groups in the areas of English, mathematics, science, and social studies at the end of their sophomore year. The highest coefficient of correlation with respect to achievement in the 1960 group was found in mathematics with an  $r = .50$ . The lowest coefficient of correlation in the 1960 group was in English with an  $r = .42$ .

However, the 1962 group had the highest coefficient of correlation in social studies with an  $r = .48$ . The correlations involved grade point averages of the two groups at the end of their sophomore years.

Further study of the two groups involved correlating raw SCAT scores and grade point averages for the top, second, third, and bottom quarters of the 1960 group and the 1962 group at the end of their sophomore year. The coefficients of correlation were found to be substantial for the top quarter of the 1960 group in English and science and for the 1962 group in English and social studies.

The conclusions of the study were:

1. The total or combined SCAT score predicted more effectively than did the verbal or quantitative score separately for both the 1960 group and the 1962 group.

2. The SCAT showed a substantial ability to predict academic achievement for freshmen and sophomores at Northeast Louisiana State College.

3. Further study was needed to determine the need of supplementary tests in the fundamental concepts of mathematics.

4. A supplementary aptitude test should be provided for freshmen who interests and abilities are not covered

in the basic English, mathematics, science, and social studies disciplines.

## CHAPTER I

### INTRODUCTION

This study was concerned with the effectiveness of the testing program at Northeast Louisiana State College. All freshmen entering college for the first time complete the School and College Ability Tests. The tests are designed to predict the ability of the student to do college work in the quantitative and verbal areas during the freshman and sophomore years of college.

The scores made by the students on the School and College Ability Tests were used to help determine placement in classes and for counseling purposes by faculty advisers. Sections were set up for remedial, average, and advanced students in English and mathematics.

The tremendous increases in college enrollments and prediction of continued increases within the next few years may accelerate the trend toward greater application of tests and examinations. The use of testing devices for purposes of admission, placement, and counseling may become more

essential as enrollments are limited because of space and teachers.

Students, especially freshmen, require assistance in selecting courses of study, scheduling course load, and extra-curricula activities.

It is obvious that all these problems cannot be solved by test data, but many of them can, because information on the student's intellectual qualifications is crucial in making intelligent decisions about the courses he will select and the curriculum he will follow. Therefore, test data should be made easily available to those who counsel freshmen.<sup>1</sup>

The Committee on Measurement and Evaluation of the American Council on Education has considered what should be done to stimulate development in the field of measurement. The two principal directions in which progress was needed were: (1) more adequate utilization of existing instruments and (2) the development of better instruments and services.<sup>2</sup>

<sup>1</sup>Committee on Measurement and Evaluation of the American Council on Education, College Testing (Washington American Council on Education, 1951), pp. 64-65.

<sup>2</sup>Committee on Measurement and Evaluation of the American Council on Education, "Improving Measurement in Higher Education," a report based upon its discussion at a meeting, January 18-22, 1958, Educational Record, 30:392, October, 1958.

In connection with these needs the Educational Testing Service has done a considerable amount of work in the development of the School and College Ability Tests.

Until this study was undertaken, no research on this question had been attempted at Northeast Louisiana State College. Though this was the case, the testing program was relied upon by the faculty advisers.

It is hoped that this study will provide counselors and administrators at Northeast Louisiana State College with information for counseling and teaching purposes that will be more helpful in the future than in the past. Information gained through this study on the validity of the SCAT to predict academic achievement should (1) identify a student who is especially advanced or retarded in abilities needed for the next higher level of schooling and (2) suggest the level of instruction which is appropriate to the needs of the individual.<sup>3</sup>

In this study the School and College Ability Tests will be referred to as the SCAT.

## STATEMENT OF THE PROBLEM

Numerous studies have been made in the attempt to ascertain what factors contribute toward success in college. Many criticisms have been voiced about the failure of our state colleges to retain many of the students that enter them. The cost of sending so many to college for a short time has aroused the need for some criteria to help determine which students have the ability to do college work and which students do not.

This need has caused the colleges to give tests to the freshmen that predict their ability to do college work. An exploratory study of this type should determine the validity of the tests used at Northeast Louisiana State College.

The specific purposes of this study were to ascertain:

- (1) the predictive validity of the SCAT for students at Northeast Louisiana State College in the quantitative areas;
- (2) the predictive validity of the SCAT for students at Northeast Louisiana State College in the verbal areas; and
- (3) the predictive validity of the SCAT for students at Northeast Louisiana State College in the combined or total quantitative and verbal areas.

## IMPORTANCE OF THE STUDY

It is difficult to determine the mental and physical strain of a sincere college student who finds himself falling below the necessary requirements to stay in school. Yet the records of Northeast Louisiana State College indicate that many students face this dilemma every year. Many failures are doubtless caused by personal factors, such as the inability to accept new responsibilities and conditions.

However, it is likely that a large number of students face this situation because of improper guidance--or a complete lack of guidance. All too frequently many students start toward a career about which they know nothing and many of them are uninformed as to their own capabilities in their chosen field.

The importance of this study lies in the fact that the validity of the SCAT to predict college success or failure at Northeast Louisiana State College will be ascertained. Finding the validity of the SCAT to predict success or failure might spare the student's expense in time and money. The college also spends a substantial amount of time and money on the testing program that may or may not be justified or well spent if the SCAT fails to predict accurately.

## DELIMITATIONS

This study was limited to the SCAT administered to the entering freshmen classes of September of 1960 and 1962. Items considered in the study were the total, quantitative, and verbal areas of English, mathematics, science, and social studies pursued during the freshman and sophomore years of the 1960 and 1962 entering classes.

This study did not include grades in non-academic courses, such as music and health and physical education activity courses.

## DEFINITION OF TERMS

Academic achievement: In this study academic achievement is the grade point average of the student.

Coefficient of correlation: The coefficient of correlation is a statistic used to measure the relationship between two sets of variables or data. The maximum value of this statistic is one. Coefficients of correlation range from -1.00 to .00 to 1.00. The nearer to one the coefficient of correlation falls, the greater the correlation between the two sets of data.<sup>4</sup>

---

<sup>4</sup>N. M. Downie, Fundamentals of Measurement (New York: Oxford University Press, 1958), p. 388.

When used as a generalized measure, the coefficient is useful in predicting group performance. This principle is widely applied in establishing criteria for college admission, or for screening candidates for training programs in industry or the military. For example, if the coefficient of correlation between scores on a particular college admission test and college academic grades were found to be consistently high, colleges might be justified in establishing admission policies on the basis of admission test scores.<sup>5</sup>

Predictive validity: Predictive validity for the purposes of this study was the ability of an instrument to predict academic achievement.

Quantitative subjects: Those subjects in the mathematics and science fields.

Validity: Validity is usually defined as the ability of an instrument to accomplish what it purports to do. In this study it is "... defined in terms of the correlation between the actual test scores and the actual grade point scores."<sup>6</sup>

---

<sup>5</sup>John W. Best, Research In Education (Englewood Cliffs: Prentice-Hall, Inc., 1959), p. 240.

<sup>6</sup>Henry E. Garrett, Statistics in Psychology and Education (New York: Longmans, Green and Company, Inc., 1958), p. 201.

Verbal subjects: Those subjects falling mainly in the English and Social Studies fields.

Throughout this study predictive efficiency and predictive validity are used interchangeably. Predictive efficiency and predictive validity are based upon the coefficients of correlation.

In the following chapter a description of the procedure, method of obtaining the data, sources of the data, and method of handling the data will be explained.

## CHAPTER II

### PROCEDURE AND SOURCES OF DATA

#### Methods of Obtaining Data

All students entering college for the first time at Northeast Louisiana State College are required to take the SCAT. The SCAT is a test designed to predict the ability of students to do college work in their freshman and sophomore years.

This study involved all students that entered Northeast Louisiana State College in September of 1960 and 1962 and remained in school long enough to receive grades in English, mathematics, science, or social studies.

There were 434 students that entered Northeast in September of 1960 and received grades in one or more of the above mentioned subjects. In 1962 there were 648 students that entered college and received one or more grades in English, mathematics, science, or social studies.

Any grades recorded on the student's transcript in English, mathematics, science, or social studies from September 1960 to June 1962 and from September 1962 to June

1964 were correlated with the SCAT scores of the same two groups. The 1960 and the 1962 groups were correlated separately.

The grade point average for each of the two groups of students was computed from the student's official transcript from the Registrar's Office. The grade point averages were based on A=4, B=3, C=2, D=1, and F=0 points for each academic hour pursued.

The SCAT scores for each student in the two groups were obtained through the Office of the Dean of Student Services from the Guidance and Testing Office.

### The Variables

The basic variables in this study which have already been defined in Chapter I, were as follows:

Grade point average: The average obtained by dividing quality points received by the number of semester hours carried is the student's grade point average.

SCAT scores: The test scores used were the raw scores made by each student in the quantitative, verbal, and total areas.

### Methods of Handling the Data

I.B.M. cards were punched for each student. Punched into the card was the student's number, SCAT scores, total

hours pursued, and total quality points.

These cards were then processed using the I.B.M. 1620 computer and a correlation program designed at the Northeast Louisiana State College Computer Research Center.

The following information was received:

1. Simple correlation coefficients for each group between:
  - a. Quantitative, verbal, and total SCAT scores and English grade point average.
  - b. Quantitative, verbal, and total SCAT scores and mathematics grade point average.
  - c. Quantitative, verbal, and total SCAT scores and social studies grade point average.
  - d. Quantitative, verbal, and total SCAT scores and science grade point average.
2. Simple correlation coefficients for the quartiles for each group between:
  - a. Quantitative, verbal, and total SCAT scores and English grade point average for the top quarter.
  - b. Quantitative, verbal, and total SCAT scores and mathematics grade point average for the second quarter.
  - c. Quantitative, verbal, and total SCAT scores and science grade point average for the third quarter.

- d. Quantitative, verbal, and total SCAT scores and social studies grade point average for the bottom quarter.

In the following chapter an analysis of the data is presented.

### CHAPTER III

#### COMPARISONS AND ANALYSIS

Analysis of a test for validity suggests the validity coefficient.<sup>7</sup> The validity coefficient numerically expresses the degree to which a test measures "what it purports to measure." In such a study the findings (validity coefficient) have import, depending almost solely upon the fidelity of some other reputable and acceptable instrument (another test).

A test that is the subject of this type of investigation is not compared directly with the other test structurally by inspection but, using a given group of students, measurements of their performance on the test being analyzed are compared, student by student, with their performance on the other test. If the test employed for making the comparison does not reflect adequately in its measurements what the test undergoing analysis is supposed

---

<sup>7</sup>John W. Best, Research In Education (Englewood Cliffs: Prentice-Hall, Inc., 1959), p. 243.

to measure, the value of the comparison obviously is cheapened and the validity coefficient ultimately obtained stands somewhat discredited. For this reason, analysis of a test such as the SCAT for validity requires first that the investigator look for another test that will measure properly what the SCAT is supposed to measure. This is another way of saying that "adequacy of the criterion" is critically important in this kind of study.

The investigation undertaken here is not to determine the truthfulness of the test under study, however, as otherwise might be implied. Simple validity is only one of several criteria of a good test. Adequate criteria used in some studies were the SAT and other aptitude tests prepared by the College Entrance Examination Board. The avowed purpose was to determine simple validity. In the present study, validity based on the correlation of the test (SCAT) with a measure of future performance--predictive validity<sup>8</sup>--of the SCAT was the object of inquiry. Again, however, a criterion is necessary. It is the thing predicted. Specifically, in this case, it is the scholastic achievement of

---

<sup>8</sup>Herschel T. Manuel, Elementary Statistics for Teachers (New York: American Book Company, 1962), p. 188.

college students, however measured by classroom tests, at Northeast Louisiana State College. The "reporting quality" of such teacher-made tests is not a question, for it is assumed that the instructors recognize, are agreed upon, and know, what represents scholastic achievement in the various subjects taught, and that they develop and use tests that reflect achievement status.

Results Compared with Results in Other Studies.

College officials are concerned with the use of aptitude tests at their particular institutions, and may inquire whether a test used for orientation purposes that has predicted successfully at a given college will function with the same success in another, more local and possibly more recent, setting. For example, the SCAT scores predicted achievement at Albright College in 1956-57, as indicated by a correlation coefficient of .43 between composite scores on the test and average grade earned in all subjects pursued.<sup>9</sup> Compared with this is the correlation coefficient of .48 in 1960 and .43 in 1962 at Northeast Louisiana State College as shown in Table I, page 16.

---

TABLE I

RELATIONSHIP OF SCORES ON THE SCAT, 1960, 1962, ENTERING  
FRESHMEN, TO ACADEMIC ACHIEVEMENT BY SUBJECT AREAS  
AT NORTHEAST LOUISIANA STATE COLLEGE

Year	Subject	Size of Sample	r
1960	Mathematics	399	.50
	Science	325	.50
	English	429	.42
	Social Studies	289	.48
1962	Mathematics	570	.41
	Science	439	.41
	English	627	.42
	Social Studies	430	.48

Structuring of the study at Albright and structuring of the present study differed, however, in some details that should be mentioned. At Albright the relationship was computed between scores on the SCAT and end-of-year grades of freshmen only. At Northeast the relationship was computed between scores on the SCAT and end-of-year grades in English, mathematics, science, and social studies for both the freshmen and sophomores. Grades of the freshmen entering in 1960 were compiled at the close of school years 1960-61 and 1961-62, and those for freshmen entering in 1962 were compiled at the close of school years 1962-63 and 1963-64. Correlations were derived by relating the SCAT scores to grades in four major content areas--mathematics, science, English, and social studies. Quantitative, verbal, and composite scores on the SCAT were separately related to these four major areas, comprising a total of one hundred fifteen different correlations in the complete study. The correlation at Albright (.43) from a sample of 126 freshmen is not as valuable for predictive purposes as those at Northeast (.47 in 1960, and .43 in 1962) in view of the larger samples at Northeast which were well over 300 in 1960 and over 400 in 1962.

Another study used the SCAT scores to predict end-of-year grades for entering freshmen. This was in 1955, conducted by the college of Arts and Sciences at the University of Denver. Correlations obtained were relatively less significant than those found at Northeast. With 189 entering freshmen as the sample, and grades taken in all subjects to constitute the criterion, the correlation coefficient reported was .51 for the composite SCAT as predictor. Reference to Table I, page 16, with particular attention to the size of samples at Northeast, indicates that the predictive efficiency of the SCAT was slightly higher than disclosed by the University of Denver.

The apparent improvement in prediction at Northeast may be attributed in part to the difference in composition of freshman groups entering these colleges. Only high school graduation is required for admission at Northeast, whereas the University of Denver evaluates applications for admission in the order filed, rated in terms of the high school transcripts as well as percentile placement on the SAT of the College Entrance Examination Board. Under a more selective plan of admission the overall academic level of any freshman class on entering college is restricted to a relatively narrow range, the less capable being screened

out. Consequently, freshman groups entering Northeast reasonably could be expected to range over a broad spectrum, while the groups admitted at Denver should range in quantitative and verbal skills over a more narrow band of the ability spectrum. Greater dispersion of individual ability in the variable sample at Northeast may have provided more heterogeneous distributions, thus inflating to some degree the resulting coefficients. Although standard deviations were not reported for the Denver study, the correlation coefficient of .51 reported probably warrants accentuation when interpreted in view of more rigid admission requirements observed in the General Catalogue of the University of Denver. On the other hand, relatively more significant coefficients from Northeast by following the same line of reasoning are accepted with subdued emphasis. The net effect is a conciliatory one terminating in the one inescapable conclusion that the significance of the correlations for predictive purposes at Northeast Louisiana State College and at the University of Denver are, as nearly as can be determined, the same.

Other Studies. The SCAT's power to predict was the subject of investigation from 1955 to 1957 also at Colorado

State University, College of William and Mary, and at Virginia Polytechnic Institute. However, the criterions were not considered as adequate (valid) at the first two named institutions as at Northeast, because grades used were first semester grades only and not end-of-year grades. VPI's study also was not a fair comparison, it was thought, in view of the subject matter content implied by technical courses as reflected in VPI's curricula. For reasons of comparability, therefore, the study at Albright College and the one at the University of Denver were examined in context with findings at Northeast. The curricula of each tend definitely toward liberal arts offerings, and end-of-year grades were employed in both studies.

Numerical Changes in Correlations and in Size of Samples. Correlation of all freshmen and sophomore end-of-year grades with their SCAT scores are presented in Table II for freshmen entering Northeast in September of 1960 and in September of 1962. One observes here: (1) identical correlations in some subject areas over the two-year interval, (2) the same numerical change over the period for certain subjects, and (3) a marked increase in the complete enumeration samples (enrollment).

TABLE II

RELATIONSHIP OF SCORES ON THE SCAT, 1960, 1962, ENTERING  
FRESHMEN, TO ACADEMIC ACHIEVEMENT BY SUBJECT AREAS

Subject	Year	Enrollment	Composite r
Mathematics	1960	399	.50
	1962	570	.41
Science	1960	325	.50
	1962	439	.41
English	1960	429	.42
	1962	627	.42
Social Studies	1960	289	.48
	1962	430	.48

Significance of Correlations and Their Change, 1960 and 1962. Further reference to Table II discloses that prediction was higher in mathematics in 1960 where, with a relatively large sample, the highest correlation (.50) was obtained. Natural sciences showed the next closest relationship (.50), but the degree of significance was attenuated by contraction in size of the sample. English grades ranked third in order of significance for prediction in 1960, having a correlation with the SCAT of .42 from a sample of 429. Lowest were the social studies subjects (.48) where a total enrollment of 289 students constituted the sample.

Noting the increase in enrollment shown in Table II for 1962 and correspondingly larger samples used in that year, and assuming that the significance of the correlations held constant, one logically must expect numerical magnitudes of the correlations to be less for 1962 than for 1960.<sup>10</sup> In some subject areas they were, as further analysis disclosed.

Two subject areas showed reduction in the coefficient with increased number of cases in 1962. These were

---

<sup>10</sup> Virginia L. Senders, Measurement and Statistics (New York: Oxford University Press, 1958), p. 547.

mathematics and science. Each showed a reduction in the coefficient, from .50 in 1960 to .41 in 1962. A closer scrutiny with respect to sample size was necessary to determine whether this reduction was to a point below which, with due regards to increase in samples, the new coefficients would not be even less significant than they were with the smaller samples in 1960. Actually the composite correlation predicted with the same degree of efficiency, achievement in mathematics and science in 1962 as it did in 1960.

Correlations for 1960 and 1962 in English and social studies remained numerically unchanged. Although increases in sample size were conspicuous in each, the coefficient held constant at .42 for English and .48 for social studies subjects. With augmentation in size of the sample, significance of correlation was accentuated, and the predictive efficiency of the composite test shows definite escalation in 1962 as related to these subjects.

Significance of Change in Coefficients by Subject Areas. All coefficients were substantially significant, as presented in Table II, at the one per cent levels.<sup>11</sup> This

---

<sup>11</sup>Garrett, p. 201.

alone confirmed previous appraisals of the SCAT as being a valid predictor. The remaining question to be explored, however, was the specific relative degree of efficiency that the composite SCAT has for predicting in different academic areas. Significance of coefficients representing the four areas were interpreted in terms of their magnitude and size of samples, and their order of value was exhibited as shown in Table III.

Achievement Levels Best Predicted. Attention was given to prediction of achievement at levels differentiated by quartiles. Grade point averages ranked according to the top, second, third, and bottom quarters in mathematics, science, English, and social studies correlated most highly in the top quarter as shown in Tables IV and V. This was conspicuously true in 1960 and 1962 and, taking into account increase in size of samples, did not recede in significance in 1962.

A slight improvement was shown in predicting the bottom quarter groups in English and social studies in 1962 over 1960. This was associated with a definite improvement in prediction for these subjects by the composite score as seen in Table II.

Most analysts look outside the test itself for factors operating favorably to produce a given co-relationship. Why English and social studies improved noticeably in strength of prediction by the SCAT both in terms of total group achievement and achievement of the extreme quarters could not be attributed to any change in the test. SCAT was not revised, but relevant external factors could have changed. A possible explanation may be that course materials and textbooks in English and social studies as taught in the high schools may have articulated more and changed less in relation to corresponding subject content in college over the 1960-64 period embraced by the study.

Potential of Verbal, Quantitative, and Composite.

Further analysis was necessary to determine whether one area of the SCAT--verbal or quantitative--functioned at a higher level than the other in predicting achievement in specific subject areas and, if so, whether it predicted in such instances with more confidence than did the composite test. Correlations, therefore, were computed to show (1) relationship between academic achievement and the quantitative scores for 1960 and 1962 entering freshmen, and (2) relationship between academic achievement and the verbal scores for 1960 and 1962 entering freshmen.

Coefficients of correlation of the composite scores with academic achievement for 1960 and 1962 groups, already presented, were listed alongside "1" and "2" above for inspection and comparison. The complete compilations are shown in Table VI for mathematics and science, and Table VII for English and social studies.

As seen in Table VI, the prediction of achievement in mathematics by the quantitative area of the SCAT, both in 1960 and 1962, was more substantial than prediction by the verbal area of the SCAT. The verbal part of the test showed a slight superiority over the quantitative in predicting grades earned in science by 1962 entering freshmen. This appears somewhat as an anomaly in the study.

Table VII reveals a consistent superiority of the verbal over the quantitative part of the SCAT in predicting success, mediocrity or failure of all freshmen pursuing English and social studies. In fact, for English alone, it predicted as effectively as did the composite test during the period 1962-64, and even better than the composite for the period 1960-62. When size of samples were considered, grades in English were in all instances more effectively predicted by the verbal than were the grades in social

studies. The level was significant enough in both, however, to be practical.

Does administering of both the quantitative and verbal parts of the SCAT provide a composite score more relevant for predictive purposes than the score from only one area, say the verbal for English and social studies or the quantitative for mathematics and science? This was a question sometimes asked by teachers. The total test score is a better criterion than either the verbal or the quantitative score taken separately to suggest degree of success in subject areas included in this study. Clearly the value of the separate parts arises from the fact that the profiles of many students show a cleavage in one direction as opposed to the other, accumulating the major portion of their total scores in one area and a correspondingly reduced portion in the other. In such cases, coefficients available from Table VI strongly suggest pursuit of mathematics and science for those scoring much higher in the quantitative than on the verbal. Table VII discloses, on the other hand, the probability of success in English and social studies or related areas for those who accomplish considerably more on the verbal part than on the quantitative. The total score, however, as coefficients in both Table VI and Table VII

show, is the most highly related to academic attainment in any of the four areas. With a very low composite score the probability of achievement in any area, as predicted by conspicuous deviation toward either verbal or quantitative, would be unlikely.

## CHAPTER IV

### CONCLUSION AND RECOMMENDATIONS

Preliminary to a summary statement of findings, the purpose of the study is here reaffirmed--to determine the predictive validity of the School and College Ability Tests (SCAT) at Northeast Louisiana State College. Such a quality is functional, not structural, and the extent to which it exists is clearly evident from a series of statistical correlations as analyzed and described in the preceding chapter. More exhaustive analysis is unnecessary, as this would lead into a domain outside the proposed study as defined in Chapter I.

Review of findings. From a recapitulation of the various correlations and their interpretations the following disclosures are made as a result of the investigation:

1. The composite score on the SCAT indicated a marked relationship for predicting academic achievement in liberal arts curricula.

2. Prediction appeared better when the SCAT scores were related to major academic courses (as at Northeast)

than when correlated with all subjects as was done at Albright College.

3. Predictive validity was essentially the same at colleges having comparable curricula, provided criteria for admitting freshmen were taken into account. (Northeast State compared with the University of Denver.)

4. Predictive validity of the composite SCAT scores either remained constant or increased (did not decline) with regard to major subject areas. (For mathematics and science it remained constant from 1960 to 1962; increased in English and social studies, 1960 and 1962.)

5. Predictive validity of the composite score was consistently more significant when employed for use with the top quarter of entering freshmen than when applied to second, third, and bottom quarters (ranked according to academic achievement) when predicting mathematics, science, English or social studies.

6. Predictive validity of the verbal portion of the SCAT as related to English and social studies was superior to the predictive validity of the quantitative part as related to mathematics and science.

Implications of findings. The study at Albright College using grades in all subjects resulted in less certitude in prediction than at Northeast when mathematics, science, English, and social studies were used. This suggests that special aptitude tests may be needed for predicting in certain subjects. These subjects may lie in a fringe area somewhat peripheral to quantitative and verbal conceptualizations. The area of the humanities, for example, may require testing of freshmen to determine unique traits not measured by the SCAT.

Emerging changes in subject content resulting from progressive enlargement and refinement of concepts in various disciplines do not adversely affect consistency of the SCAT to predict from one year to the next. Therefore, the evident stability of the test over the long term dispels any question as to the need for a complete revision to insure reliability.

Although the SCAT showed improvement in predicting English and social studies as related to the verbal part from 1960 to 1962, predictive efficiency for mathematics and science as related to the quantitative portion remained the same. This implies a need for a supplementary aptitude test for use with the SCAT if the level of confidence in

prediction for mathematics and science is to be maintained equivalent to that in English and social studies.

The SCAT shows a weakness from failure to predict students of average or low achievement. Since many studies show a very significant relationship between achievement and intelligence, a general intelligence test might be administered to identify entering freshmen of average and low ability who are less subject to prediction by the SCAT.

Conclusions and recommendations. Clear-cut and definitive recommendations seldom proceed from an exploratory study. From an improved sense of direction, however, tentative conclusions are submitted subject to further study and verification.

1. In the absence of any evidence to indicate a pronounced deficiency in the SCAT, it should remain in the portfolio battery of tests employed at Northeast Louisiana State College for guidance and counseling.

2. It is suggested that further study be made concerning tests on mathematics fundamentals. Further study may warrant exercises adapted to measurement of the mechanics of conventional computational skills as well as basic concepts in the new mathematics as recommended by the Mathematics Study Group of the National Science Foundation.

3. A supplementary aptitude test should be provided for freshmen who announce a confirmed predisposition to pursue a special area of the humanities not touched upon by the basic disciplines--mathematics, science, English, and social studies. These might conceivably include tests in art aptitude, music aptitude, dramatics aptitude, speech aptitude and others.

## BIOGRAPHY

Arnold R. Kilpatrick, the youngest child of Luther L. and Blanche B. Kilpatrick, was born at Eros, Louisiana, on August 5, 1920. After graduation from Eros High School in 1938, he entered Northeast Junior College of Louisiana State University for two years of college work. He received a Bachelor of Arts degree at Northwestern State College of Louisiana in 1944. He began his graduate study at Louisiana State University in 1951 and received a Master of Education degree in 1953. He re-entered this institution in January, 1959 and completed the requirements for the Doctor of Education degree in August, 1965.

His teaching career began in 1946, after having served for three years as a meteorologist in the Army Air Force, at Jonesboro-Hodge High School as a social studies, mathematics, and health and physical education teacher and served as the basketball coach and assistant football coach for five years. In 1951, he moved to the newly formed Northeast Louisiana State College, as Athletic Director and basketball coach and Assistant Professor of Education. He

has remained at Northeast Louisiana State College and is now an Associate Professor of Education.

He was married to Juanita Cardozier, of Montgomery, Louisiana, in 1950. Their daughter, Lael, was born on August 26, 1952, and their son, Young, was born on April 4, 1956.

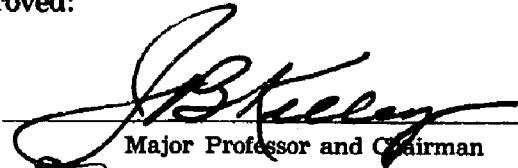

## EXAMINATION AND THESIS REPORT

Candidate: Arnold R. Kilpatrick

Major Field: Education

Title of Thesis: The Effectiveness of the School and College Ability Tests  
as a Predictor of Undergraduate Academic Achievement  
at Northeast Louisiana State College

Approved:

  
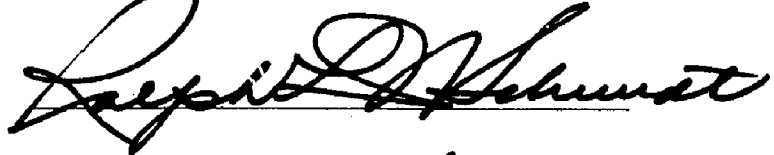

Major Professor and Chairman

  
Dean of the Graduate School

### EXAMINING COMMITTEE:

Date of Examination:

June 10, 1965
